Supported by:

Federal Ministry
of Economics
and Technology

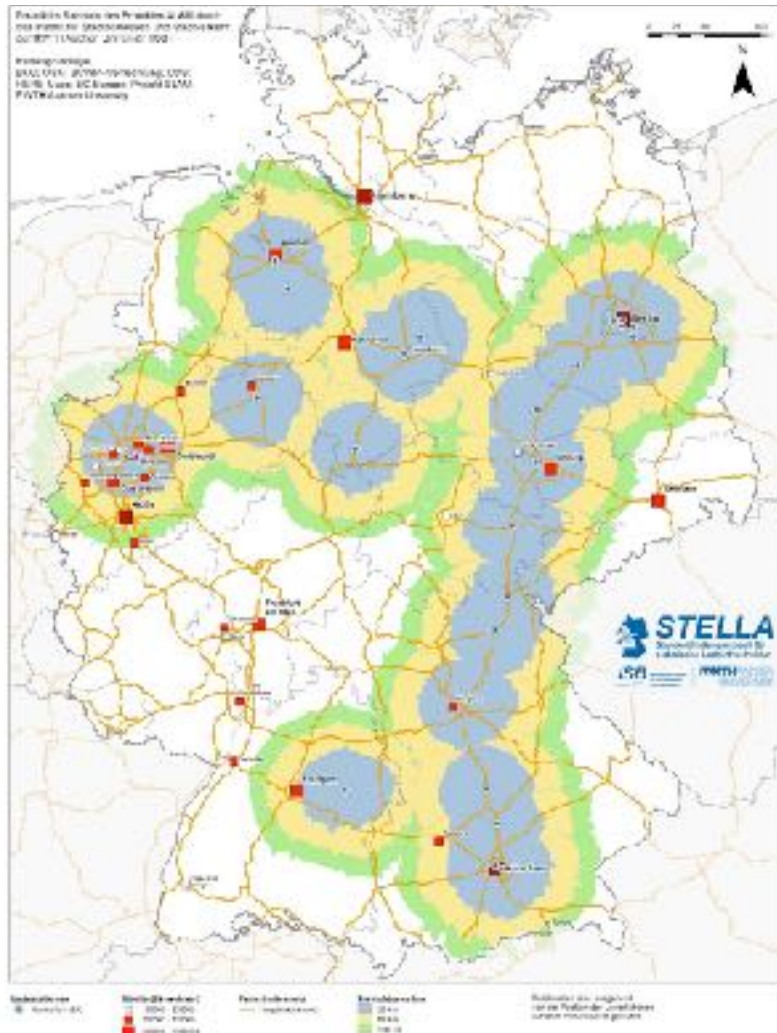

on the basis of a decision
by the German Bundestag

Agenda

- ❑ Fast-Charging in Germany
- ❑ Approach
 - ❑ Project SLAM
 - ❑ Fast-Charging Research Network
 - ❑ Database
- ❑ Analysis
- ❑ Results & Discussion

Fast-Charging Infrastructure in Germany

Source: ISB, RWTH Aachen

Back in 2014...

- ❑ Single epicentres of fast-charging infrastructure
- ❑ Large-scale white spots without charging infrastructure
- ❑ Hardly any connection between metropolises (except Autobahn A9)
- ❑ ...

At that point, EVs were not convenient for long-distance trips!

Project SLAM: Objectives

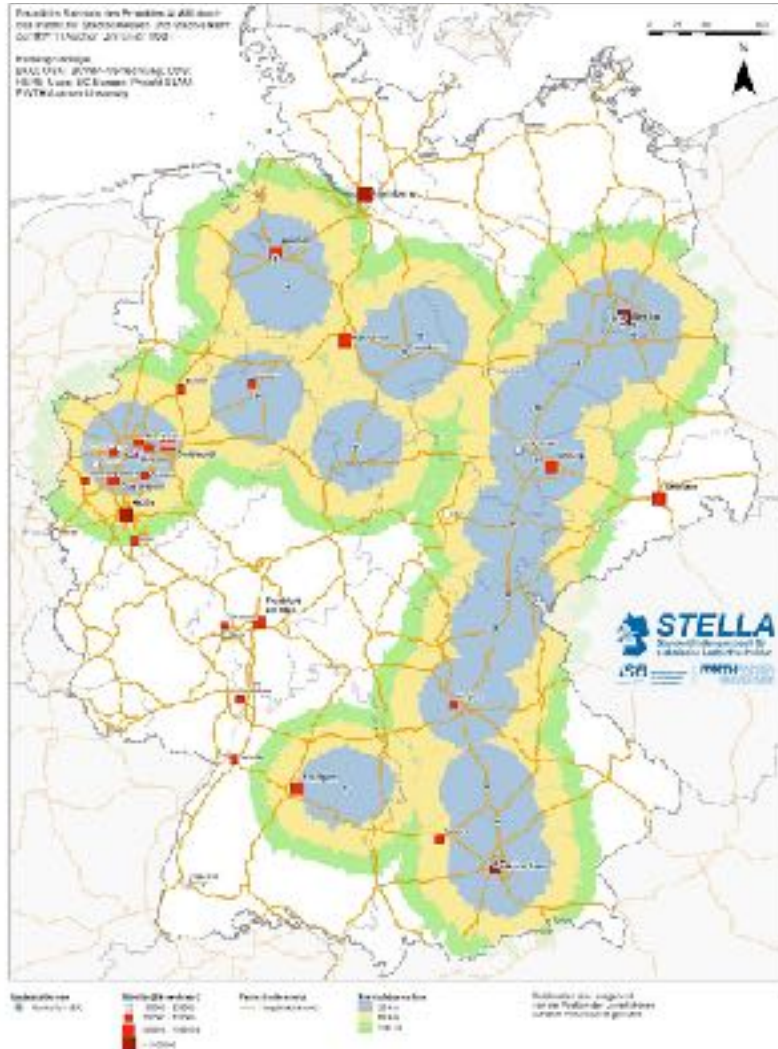

- ❑ Development of the biggest fast-charging research network in Germany
- ❑ Establishment of up to 200 fast-charging points with the help of private investors
- ❑ Research issues:
 - ❑ Analysing attractiveness and potential of locations
 - ❑ Understanding, development and evaluation of business models
 - ❑ Identifying the challenges of setting-up fast-charging infrastructures
 - ❑ ...

Fast-Charging Research Network

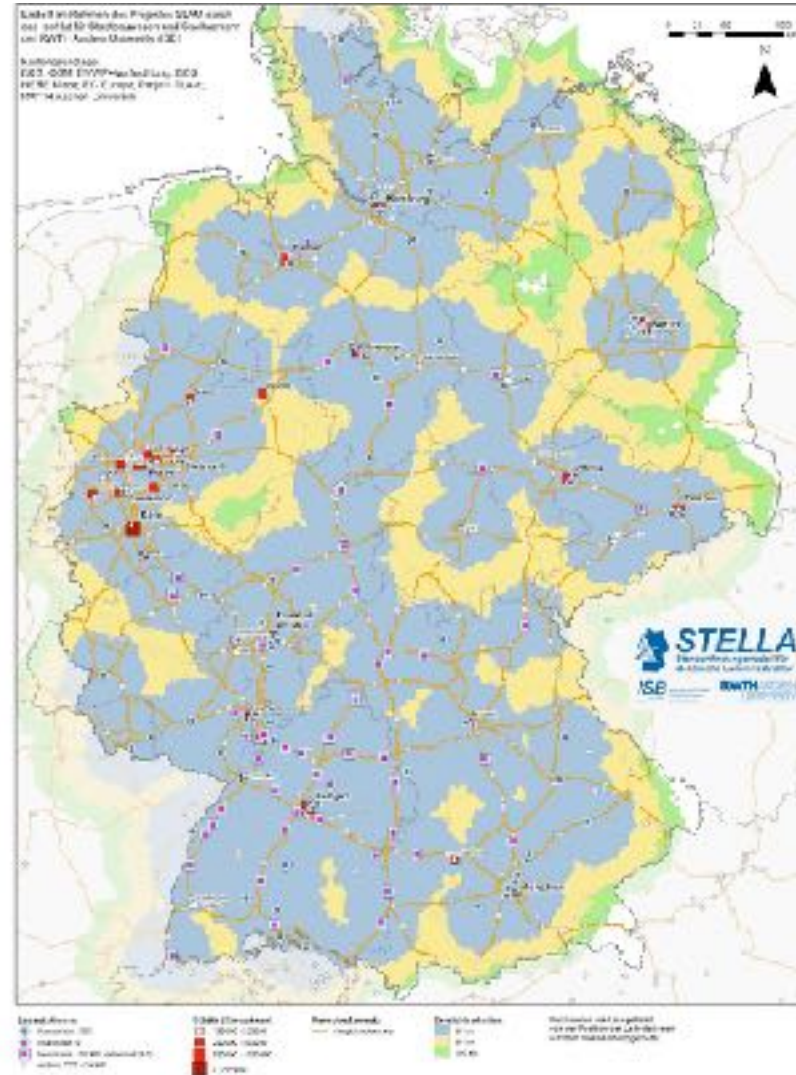

2014

Source: ISB, RWTH Aachen

2017

Source: ISB, RWTH Aachen

Project SLAM: Framework for investors

- Setup:
Up to 4 charging stations at hot spot locations*

Source: SLAM – Schnellladenetz für Achsen und Metropolen

...

Source: SLAM – Schnellladenetz für Achsen und Metropolen

- Option:
Enabling of high performance charging on grid side
(150 kW for each DC-outlet)

* Hot spots are locations with a prospectively high number of EV-drivers

Existing Database from NPE

- National Platform Electromobility (NPE) delivered in 2015 the following estimation about CapEx for establishing fast-charging stations with 50 kW DC in Germany*

Hardware	Grid Connection	Location Search, Planning, Permission	Civil Engineering, Assembly
25.000,00 EUR	5.000,00 EUR	1.500,00 EUR	3.500,00 EUR
Σ : 35.000,00 EUR			

- When enabling high performance charging on grid side (150 kW each DC-Outlet), costs for grid connection shoot up...

Hardware	Grid Connection	Location Search, Planning, Permission	Civil Engineering, Assembly
25.000,00 EUR	50.000,00 EUR	1.500,00 EUR	3.500,00 EUR
Σ : 80.000,00 EUR			

* Nationale Plattform Elektromobilität, Ladeinfrastruktur für Elektrofahrzeuge in Deutschland, Berlin, November 2015, chapter 3

Project SLAM: Current Status

- ❑ To date, the SLAM research network comprises 66 locations with 174 fast-charging points (established by 10 investors)
- ❑ 21 of 66 locations are equipped with
 - ❑ 4 fast-charging stations each (50 kW DC each)
 - ❑ High performance enabled on grid side (150 kW DC each DC-Outlet)
 - ❑ Making it round about 800 kW for the whole location
- ❑ 19 locations were taken into consideration for the following analysis

**Location distribution
SLAM-Network 08/2017**

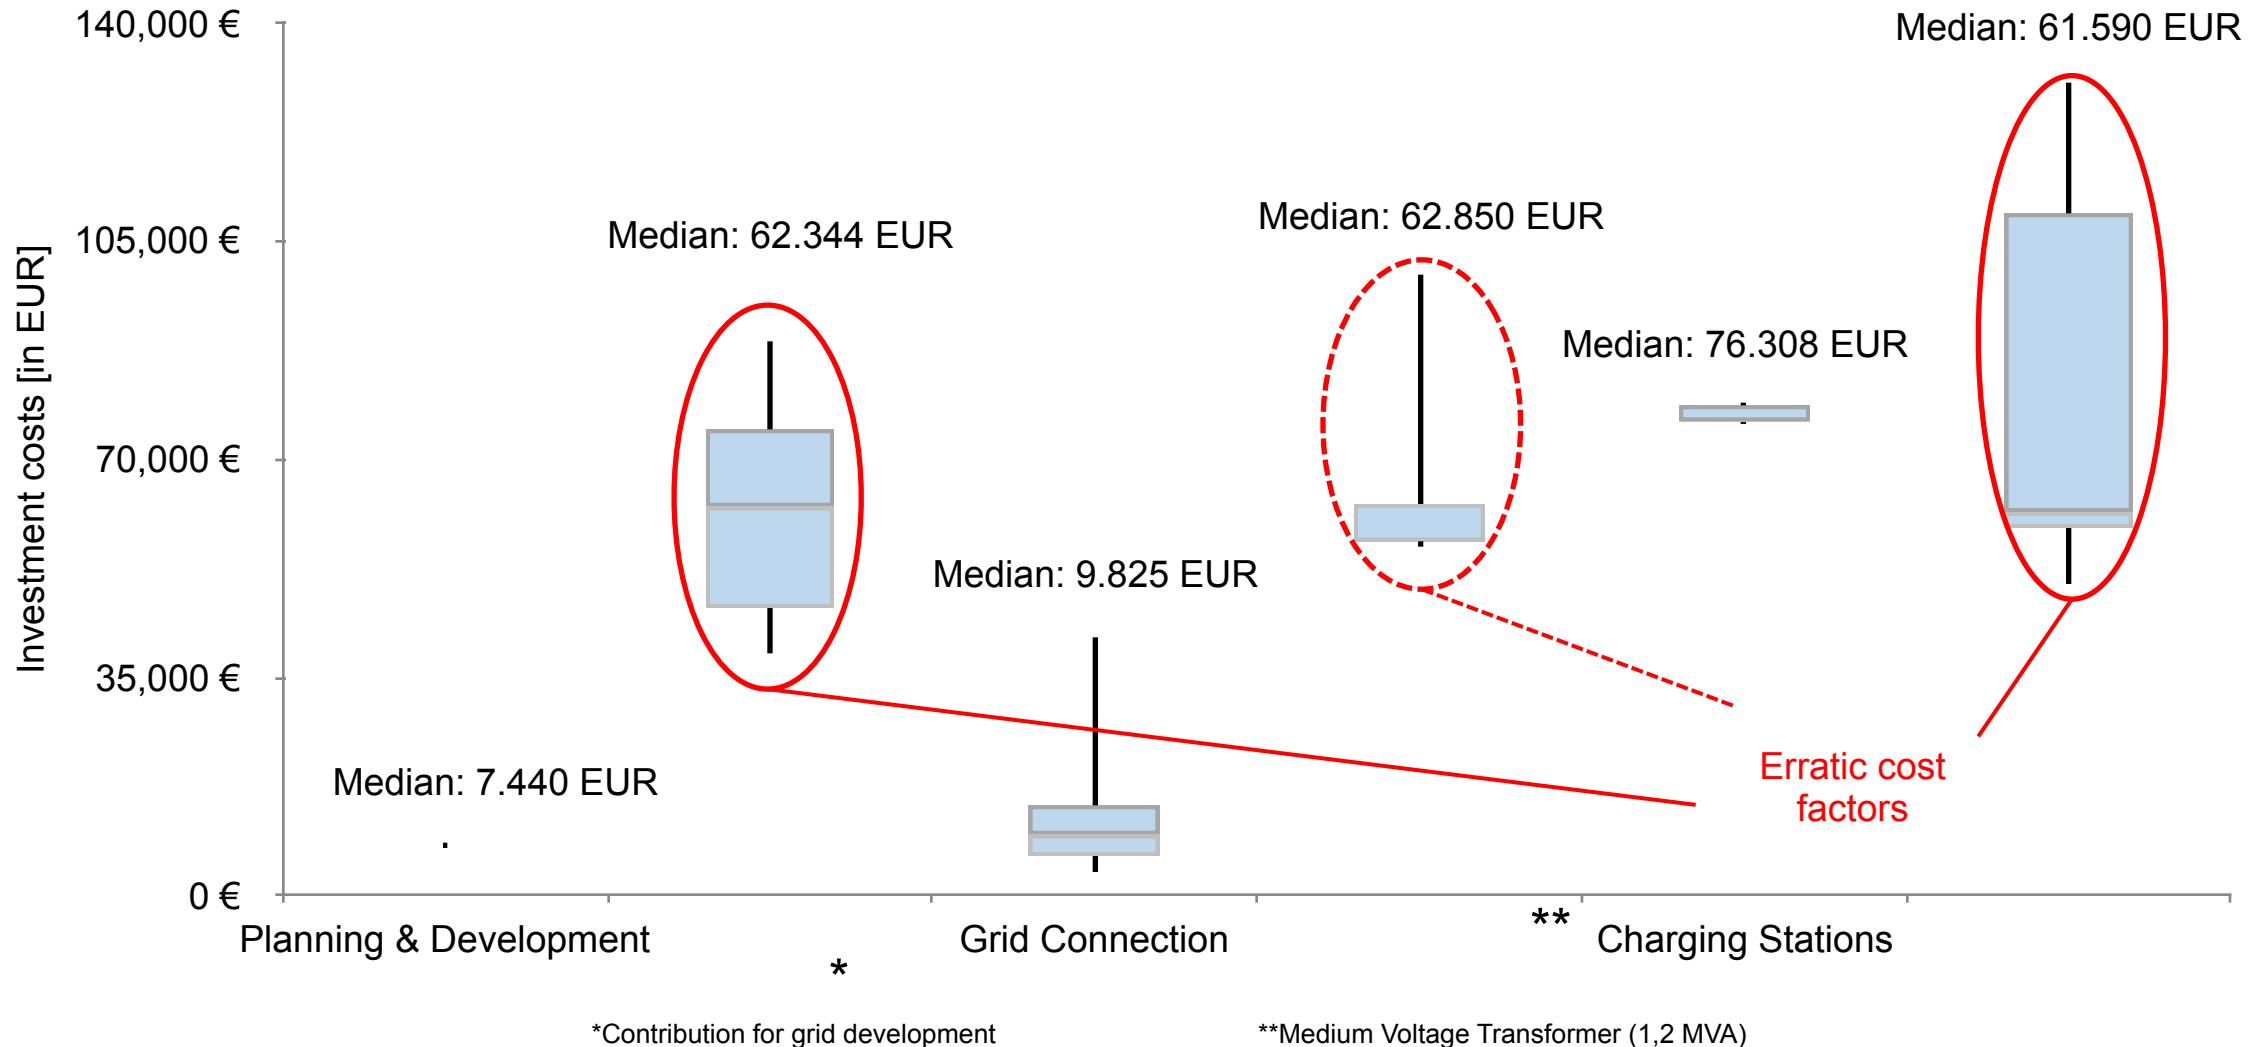

Investment costs by scenario
(19 locations: 4 charging stations each & 800kW on the grid side)

Analysis: Classification in Categories

Investment costs by category
(19 locations: 4 charging stations & 800kW on the grid side each)

Preliminary Results

- Major differences between single locations in investment costs
- Comparing best and worst case scenarios, investment costs can be doubled up
- Essential investment volume depends on
 - Site conditions (Civil engineering)
 - Grid operator (Grid development)
 - Grid operator (Medium voltage transformer)

Business Perspective

Average Number of Charging Sessions (> 1kWh) per Location each Month

Snapshot of
current market
situation!

Amortisation rate of investment (per month)		
Average costs	Best case scenario	Worst case scenario
4.730 EUR	3.590 EUR	6.935 EUR
97 - 315 EUR each charging session	73 - 239 EUR each charging session	142 - 462 EUR each charging session

Subsidies not
included!

Impact of investment costs on business model

- ❑ Attractiveness of certain (expensive) locations is poor
- ❑ Competitive position against nearby and less expensive locations is weak
- ❑ In the short / medium term, business models exclusively based on the sale of charging time are critical

Impact on nation-wide establishment of fast-charging infrastructure

- ❑ Risk of white spots at important traffic points
- ❑ Increasing the density on the fast-charging map isn't too attractive so far
- ❑ Without public funding, a nationwide fast-charging network would be out of reach
